

Introduction & Basics

1. A sequence in Python is defined as:
 - A) An unordered collection of items
 - B) An orderly collection of items indexed by integers
 - C) A collection of key-value pairs
 - D) A single data value
 2. Which of the following data types are sequence data types in Python?
 - A) Strings, Lists, Tuples
 - B) Strings, Dictionaries, Sets
 - C) Lists, Dictionaries, Sets
 - D) Tuples, Dictionaries, Sets
 3. Which data type falls under the category of mapping?
 - A) List
 - B) Tuple
 - C) String
 - D) Dictionary
 4. Which chapter covers Lists in detail?
 - A) Chapter 5
 - B) Chapter 8
 - C) Chapter 9
 - D) Chapter 10
 5. Tuples and Dictionaries are discussed in which chapter?
 - A) Chapter 8
 - B) Chapter 9
 - C) Chapter 10
 - D) Chapter 11
-

Definition of String

6. A string in Python is a sequence of:
 - A) ASCII characters
 - B) Binary digits
 - C) UNICODE characters
 - D) Numeric characters only
7. Which of the following can be part of a string character?
 - A) Letters
 - B) Digits
 - C) Whitespace
 - D) All of the above
8. A string can be created using:
 - A) Single quotes only
 - B) Double quotes only

- C) Triple quotes only
 - D) Single, double, or triple quotes
9. Which of the following declarations creates a valid string?
- A) `str1 = Hello`
 - B) `str1 = 'Hello'`
 - C) `str1 = (Hello)`
 - D) `str1 = {Hello}`
10. Triple-quoted strings are mainly used to:
- A) Store numeric values
 - B) Store single characters
 - C) Extend strings across multiple lines
 - D) Improve execution speed
11. Strings created using single, double, and triple quotes differ in:
- A) Data type
 - B) Memory allocation
 - C) Value stored
 - D) None of the above
-

Accessing Characters (Indexing)

12. Characters in a string are accessed using:
- A) Parentheses
 - B) Curly braces
 - C) Square brackets
 - D) Angle brackets
13. The index of the first character in a string is:
- A) 1
 - B) -1
 - C) 0
 - D) Depends on length
14. The index of the last character of a string of length n is:
- A) n
 - B) $n + 1$
 - C) $n - 1$
 - D) $-n$
15. If an index value is outside the valid range, Python raises:
- A) `ValueError`
 - B) `TypeError`
 - C) `IndexError`
 - D) `SyntaxError`
16. String index values must be:
- A) Float
 - B) String

- C) Integer
 - D) Boolean
17. Which of the following index values is invalid?
- A) 0
 - B) -1
 - C) 2+3
 - D) 1.5
18. An index expression in string indexing must evaluate to:
- A) String
 - B) Float
 - C) Integer
 - D) Boolean
19. Negative indexing in strings is used to:
- A) Skip characters
 - B) Access characters from right to left
 - C) Reverse strings automatically
 - D) Remove characters
20. The index of the first character from the right side is:
- A) 0
 - B) -n
 - C) -1
 - D) n
21. The index of the last character from the right side is:
- A) -1
 - B) -n
 - C) 0
 - D) n
22. Python has a separate character data type.
- A) True
 - B) False
 - C) Only for alphabets
 - D) Only for digits
23. A string of length one is considered as:
- A) Integer
 - B) Boolean
 - C) Character
 - D) List
-

len() Function

24. The len() function returns:
- A) Number of words
 - B) Number of characters

- C) Memory size
- D) Number of vowels

25. The length of the string 'Hello World!' is:
- A) 10
 - B) 11
 - C) 12
 - D) 13
26. Which expression gives the last character of a string str1 using length?
- A) str1[len(str1)]
 - B) str1[len(str1)-1]
 - C) str1[len(str1)+1]
 - D) str1[-len(str1)-1]
27. Which expression gives the first character using negative indexing?
- A) str1[-1]
 - B) str1[0]
 - C) str1[-len(str1)]
 - D) str1[len(str1)]
-

Immutability of Strings

28. Strings in Python are:
- A) Mutable
 - B) Immutable
 - C) Dynamic
 - D) Temporary
29. Attempting to change a character in a string results in:
- A) SyntaxError
 - B) IndexError
 - C) TypeError
 - D) NameError
30. Which operation is NOT allowed on strings?
- A) Indexing
 - B) Slicing
 - C) Concatenation
 - D) Item assignment
-

String Operations

Concatenation

31. Concatenation means:
- A) Repeating strings
 - B) Comparing strings

- C) Joining strings
- D) Reversing strings

32. Which operator is used for string concatenation?

- A) *
- B) +
- C) %
- D) &

33. After concatenation, the original strings:

- A) Change permanently
- B) Become empty
- C) Remain unchanged
- D) Become mutable

Repetition

34. The repetition operator is represented by:

- A) +
- B) *
- C) **
- D) //

35. Which expression repeats a string 5 times?

- A) str * 5
- B) 5 + str
- C) str + 5
- D) repeat(str,5)

36. After using the repetition operator, the original string:

- A) Changes
- B) Is deleted
- C) Remains the same
- D) Becomes empty

Membership Operators

37. Which operator checks whether a substring exists in a string?

- A) is
- B) in
- C) ==
- D) has

38. The in operator returns True when:

- A) Both strings are equal
- B) First string is a substring of the second
- C) Second string is longer
- D) Strings are concatenated

39. The not in operator returns True when:

- A) Substring exists
 - B) Substring does not exist
 - C) Strings are equal
 - D) Strings are reversed
-

Slicing

40. Slicing is used to:

- A) Delete characters
- B) Replace characters
- C) Retrieve a portion of a string
- D) Sort characters

41. In slicing `str1[n:m]`, index `n` is:

- A) Exclusive
- B) Inclusive
- C) Ignored
- D) Optional

42. In slicing `str1[n:m]`, index `m` is:

- A) Inclusive
- B) Exclusive
- C) Always included
- D) Negative only

43. The number of characters in `str1[n:m]` is:

- A) $n + m$
- B) $m - n$
- C) $n - m$
- D) $m + n$

44. If the starting index is greater than the ending index, slicing returns:

- A) Error
- B) None
- C) Empty string
- D) Original string

45. If the starting index is omitted, slicing starts from:

- A) Index 1
- B) Index -1
- C) Index 0
- D) Middle

46. If the ending index is omitted, slicing goes till:

- A) Index 0
- B) Middle of string
- C) End of string
- D) Index -1

47. The third slicing parameter represents:

- A) Length
- B) Index
- C) Step size
- D) Offset

48. Default step size in slicing is:

- A) 0
- B) 1
- C) 2
- D) -1

49. Negative step size is used to:

- A) Skip vowels
- B) Skip spaces
- C) Reverse the string
- D) Remove characters

Traversing a String

50. Traversing means:

- A) Sorting characters
- B) Accessing each character one by one
- C) Replacing characters
- D) Joining strings

51. A string can be traversed using:

- A) for loop only
- B) while loop only
- C) Both for and while loops
- D) do-while loop

52. In a for loop traversal, the loop ends when:

- A) Index becomes zero
- B) Last character is accessed
- C) Error occurs
- D) User stops input

53. In while loop traversal, the loop condition uses:

- A) Index > length
- B) Index == length
- C) Index < length
- D) Index <= length

String Methods & Built-in Functions

54. Which function returns the length of a string?

- A) count()
- B) length()

- C) len()
- D) size()

55. The title() method converts:
- A) Entire string to uppercase
 - B) Entire string to lowercase
 - C) First letter of every word to uppercase
 - D) Last letter of every word to uppercase
56. lower() method converts:
- A) All letters to uppercase
 - B) All letters to lowercase
 - C) Only first letter
 - D) Only last letter
57. upper() method converts:
- A) All letters to lowercase
 - B) All letters to uppercase
 - C) Only vowels
 - D) Only consonants
58. count() returns:
- A) Position of substring
 - B) Boolean value
 - C) Number of occurrences
 - D) Index range
59. If start and end are not given in count(), searching is done:
- A) From middle
 - B) From end
 - C) From index 0 to length
 - D) From index 1
60. find() returns -1 when:
- A) Substring is found
 - B) Substring is not found
 - C) String is empty
 - D) Index is negative
61. index() differs from find() because index():
- A) Returns -1
 - B) Returns Boolean
 - C) Raises an exception
 - D) Returns string
62. endswith() checks:
- A) Beginning of string
 - B) Middle of string
 - C) End of string
 - D) Entire string

63. startswith() checks:
- A) Ending substring
 - B) Starting substring
 - C) Middle substring
 - D) Any substring
64. isalnum() returns False if string contains:
- A) Alphabets
 - B) Digits
 - C) Special symbols
 - D) Letters
65. islower() returns True if:
- A) All characters are lowercase
 - B) At least one lowercase alphabet and rest non-alphabet
 - C) String contains digits
 - D) String is empty
66. isupper() returns False if:
- A) Digits are present
 - B) String is empty
 - C) Lowercase letters exist
 - D) Special symbols exist
67. isspace() returns True if string contains only:
- A) Letters
 - B) Digits
 - C) Whitespaces
 - D) Symbols
68. istitle() returns True if:
- A) All letters are uppercase
 - B) All letters are lowercase
 - C) Each word starts with uppercase
 - D) String has no spaces
69. lstrip() removes spaces from:
- A) Right side
 - B) Left side
 - C) Both sides
 - D) Middle
- 70.rstrip() removes spaces from:
- A) Left side
 - B) Right side
 - C) Both sides
 - D) Middle
71. strip() removes spaces from:
- A) Left only
 - B) Right only

- C) Both left and right
 - D) Middle only
72. replace() method replaces:
- A) First occurrence only
 - B) Last occurrence only
 - C) All occurrences
 - D) Middle occurrence
73. join() method joins characters using:
- A) Space
 - B) Separator
 - C) Index
 - D) Operator
74. partition() returns:
- A) Two parts
 - B) Three parts
 - C) Four parts
 - D) List
75. If separator is not found, partition() returns:
- A) Error
 - B) Empty tuple
 - C) Original string and two empty strings
 - D) None
76. split() returns:
- A) Tuple
 - B) Dictionary
 - C) List
 - D) Set

Handling Strings – Programs

77. A palindrome string:
- A) Contains only vowels
 - B) Is case-sensitive always
 - C) Reads same forwards and backwards
 - D) Contains no spaces
