

MCQ Questions: Tuples and Dictionaries (Class XI)

1. A tuple in Python is defined as:

- A. An unordered collection of elements
 - B. An ordered sequence of elements
 - C. A mutable sequence of elements
 - D. A collection of key-value pairs
-

2. Elements of a tuple are enclosed within:

- A. Curly braces { }
 - B. Square brackets []
 - C. Parentheses ()
 - D. Angle brackets < >
-

3. Which of the following data types can be stored in a tuple?

- A. Integer only
 - B. String only
 - C. List and tuple only
 - D. Integer, float, string, list, and tuple
-

4. Indexing in a tuple starts from:

- A. 1
 - B. -1
 - C. 0
 - D. Any number
-

5. What will be the type of tuple5 = (20)?

- A. tuple
 - B. list
 - C. int
 - D. float
-

6. Which is the correct way to create a single-element tuple?

- A. (5)
 - B. (5,)
 - C. [5]
 - D. {5}
-

7. A sequence without parentheses but with commas is treated as:

- A. List
 - B. Dictionary
 - C. Tuple
 - D. String
-

8. Which operation is used to access elements of a tuple?

- A. Key mapping
 - B. Indexing
 - C. Hashing
 - D. Casting
-

9. What does negative indexing in a tuple indicate?

- A. Index from left
 - B. Index from right
 - C. Error condition
 - D. Index reset
-

10. Tuple is called immutable because:

- A. It cannot store different data types
 - B. Its size cannot increase
 - C. Its elements cannot be modified
 - D. It does not support indexing
-

11. Which of the following causes an error?

- A. Accessing tuple element
 - B. Slicing a tuple
 - C. Modifying a tuple element
 - D. Using len() on a tuple
-

12. If a tuple contains a list as an element, then:

- A. The list cannot be modified
 - B. The tuple becomes mutable
 - C. The list inside the tuple can be modified
 - D. The tuple becomes invalid
-

13. Which operator is used for tuple concatenation?

- A. *
 - B. +
 - C. &
 - D. :
-

14. What is the result of tuple concatenation?

- A. A modified tuple
 - B. A list
 - C. A new tuple
 - D. An error
-

15. Which operator is used for repetition of a tuple?

- A. +
 - B. *
 - C. %
 - D. /
-

16. The repetition operator requires the second operand to be:

- A. Float
 - B. String
 - C. Tuple
 - D. Integer
-

17. Which operator checks membership in a tuple?

- A. is
 - B. ==
 - C. in
 - D. =
-

18. What does slicing in a tuple return?

- A. An integer
 - B. A list
 - C. A string
 - D. A tuple
-

19. Which slicing operation reverses a tuple?

- A. tuple[::-1]
- B. tuple[1:-1]

- C. tuple[-1]
 - D. tuple[:1]
-

20. Which function returns the number of elements in a tuple?

- A. size()
 - B. count()
 - C. len()
 - D. sum()
-

21. Which method counts occurrences of an element in a tuple?

- A. find()
 - B. index()
 - C. count()
 - D. len()
-

22. The index() method returns:

- A. Number of elements
 - B. First occurrence index
 - C. Last occurrence index
 - D. Total count
-

23. What does sorted() return when applied on a tuple?

- A. Sorted tuple
 - B. Sorted dictionary
 - C. Sorted list
 - D. Modified tuple
-

24. Which function returns the smallest element of a tuple?

- A. sum()
 - B. min()
 - C. max()
 - D. len()
-

25. Tuple assignment requires:

- A. More variables than values
- B. Same number of variables and values
- C. Fewer values than variables
- D. Variables inside list

26. What happens if values are fewer than variables in tuple assignment?

- A. No error
- B. IndexError
- C. ValueError
- D. TypeError

27. A tuple inside another tuple is called:

- A. Multilevel tuple
- B. Inner tuple
- C. Nested tuple
- D. Complex tuple

28. Which data type is best suited for fixed records?

- A. List
- B. Tuple
- C. Set
- D. Dictionary

29. Swapping two variables without a temporary variable uses:

- A. List assignment
- B. Tuple assignment
- C. Dictionary assignment
- D. Set assignment

30. A function returning multiple values actually returns:

- A. List
- B. Dictionary
- C. Set
- D. Tuple

31. Dictionary belongs to which category of data type?

- A. Scalar
 - B. Sequence
 - C. Mapping
 - D. Numeric
-

32. Dictionary items are stored as:

- A. Single values
 - B. Key-value pairs
 - C. Lists
 - D. Tuples only
-

33. Dictionary keys must be:

- A. Mutable
 - B. Immutable
 - C. Lists
 - D. Dictionaries
-

34. Which brackets are used to create a dictionary?

- A. ()
 - B. []
 - C. { }
 - D. < >
-

35. How are dictionary items accessed?

- A. Index
 - B. Position
 - C. Key
 - D. Slice
-

36. What error occurs when a key is not found?

- A. IndexError
 - B. NameError
 - C. KeyError
 - D. ValueError
-

37. Dictionaries are:

- A. Immutable
 - B. Fixed size
 - C. Mutable
 - D. Sequential
-

38. How do you add a new item to a dictionary?

- A. Using append()
 - B. Using add()
 - C. Assigning a new key
 - D. Using insert()
-

39. Which method returns all keys of a dictionary?

- A. values()
 - B. items()
 - C. keys()
 - D. get()
-

40. Which method safely retrieves a value and returns None if key is absent?

- A. index()
 - B. get()
 - C. fetch()
 - D. find()
-

41. Which method removes all items from a dictionary?

- A. remove()
 - B. del()
 - C. clear()
 - D. popall()
-

42. Traversing a dictionary can be done using:

- A. while loop only
 - B. for loop
 - C. do-while loop
 - D. recursion only
-

43. dict.items() returns:

- A. Keys only
 - B. Values only
 - C. List of tuples
 - D. Dictionary
-

44. Which operation checks key presence in a dictionary?

- A. has()
- B. in

- C. exists()
 - D. find()
-

45. Which data type is ideal for storing roll number and student details?

- A. List
 - B. Tuple
 - C. Dictionary
 - D. Set
-

46. Dictionary values can be:

- A. Only immutable
 - B. Only integers
 - C. Any data type
 - D. Only strings
-

47. What happens when `del dict_name` is executed?

- A. Dictionary becomes empty
 - B. One item is removed
 - C. Dictionary is deleted from memory
 - D. Keys are deleted
-

48. Converting digits to words uses:

- A. Tuple
 - B. Set
 - C. Dictionary
 - D. List
-

49. Tuples are preferred over lists when:

- A. Data needs frequent changes
- B. Data is fixed
- C. Data is unordered
- D. Keys are required
