

MULTIPLE CHOICE QUESTIONS

Chapter: Security Aspects

General & Introduction

1. Network security mainly deals with:
(A) Improving computer speed
(B) Protection of devices and data from illegitimate access
(C) Enhancing graphics performance
(D) Increasing internet bandwidth
 2. A computer completely isolated from other devices is:
(A) Always impractical
(B) Free from network security threats
(C) Vulnerable to malware
(D) Unsafe for data storage
 3. Threats in network security include:
(A) Legal software updates
(B) Exploitation of vulnerabilities
(C) Hardware upgrades
(D) Data compression
 4. Network threats mainly arise due to:
(A) Isolation of systems
(B) Interconnection of devices
(C) Lack of storage
(D) High processing power
-

Malware (General)

5. The term Malware stands for:
(A) Managed hardware
(B) Malicious software
(C) Machine learning software
(D) Modular application
6. Malware is designed mainly to:
(A) Improve user experience
(B) Damage hardware or steal data
(C) Increase system efficiency
(D) Optimize network traffic
7. Financial damage caused by malware worldwide is:
(A) Negligible
(B) Limited to individuals
(C) Worth billions of dollars annually
(D) Only related to hardware loss

8. Which of the following is NOT a type of malware?
- (A) Virus
 - (B) Worm
 - (C) Compiler
 - (D) Spyware
-

Virus

9. The term “computer virus” was coined by:
- (A) Alan Turing
 - (B) Clifford Stoll
 - (C) Fred Cohen
 - (D) Tim Berners-Lee
10. A computer virus spreads mainly by:
- (A) Network cables
 - (B) Copying its code into executable files
 - (C) Hardware failure
 - (D) BIOS update
11. A virus becomes active when:
- (A) System boots
 - (B) Antivirus is installed
 - (C) Infected file is executed
 - (D) Internet is disconnected
12. Which resource can be hampered by a virus?
- (A) CPU time
 - (B) Memory
 - (C) Personal files
 - (D) All of the above
13. Which of the following is a known computer virus?
- (A) WannaCry
 - (B) ILOVEYOU
 - (C) Storm Worm
 - (D) Morris Worm
-

Worms

14. A major difference between a worm and a virus is that a worm:
- (A) Requires human action to spread
 - (B) Needs a host file
 - (C) Is a standalone program
 - (D) Cannot spread through networks
15. Worms spread primarily through:
- (A) Email attachments only
 - (B) Network connections

- (C) Keyboard input
- (D) Hardware drivers

16. Which of the following is an example of a worm?

- (A) Netsky
- (B) Code Red
- (C) CryptoLocker
- (D) Stuxnet

Ransomware

17. Ransomware mainly targets:

- (A) Hardware components
- (B) User data
- (C) System clock
- (D) Display settings

18. Ransomware may block user data by:

- (A) Deleting files permanently
- (B) Encrypting data
- (C) Reducing memory
- (D) Changing file names

19. WannaCry ransomware demanded ransom in:

- (A) Dollars
- (B) Rupees
- (C) Bitcoin
- (D) Ethereum

20. WannaCry infected computers across approximately:

- (A) 50 countries
- (B) 100 countries
- (C) 150 countries
- (D) 200 countries

Trojan

21. A Trojan gets its name from:

- (A) Roman mythology
- (B) Greek strategy involving a wooden horse
- (C) Malware creator
- (D) UNIX programming

22. A Trojan spreads mainly through:

- (A) Automatic replication
- (B) User interaction
- (C) Network flooding
- (D) Firewall bypass

23. Which statement about Trojans is correct?

- (A) They self-replicate
 - (B) They infect executable files
 - (C) They appear as legitimate software
 - (D) They spread without user action
-

Spyware

24. Spyware mainly:

- (A) Displays advertisements
- (B) Records user activities secretly
- (C) Encrypts files
- (D) Blocks system access

25. Spyware may collect:

- (A) Credit card details
 - (B) Login credentials
 - (C) Internet usage data
 - (D) All of the above
-

Adware

26. Adware is created mainly to:

- (A) Improve security
- (B) Generate revenue
- (C) Prevent malware
- (D) Encrypt files

27. Adware generates income using:

- (A) Subscription model
- (B) Pay-per-click mechanism
- (C) Hardware sales
- (D) Firewall access

28. Adware is usually:

- (A) Highly destructive
 - (B) Harmless but annoying
 - (C) Always beneficial
 - (D) A system utility
-

Keyloggers

29. A keylogger records:

- (A) Screen pixels
- (B) Mouse movement
- (C) Keyboard keystrokes
- (D) Network packets

30. A keylogger can be:
- (A) Only software
 - (B) Only hardware
 - (C) Both software and hardware
 - (D) Only firmware
31. One way to reduce keylogger risk is using:
- (A) BIOS password
 - (B) Virtual keyboard
 - (C) Faster CPU
 - (D) External mouse
-

On-Screen vs Online Virtual Keyboard

32. On-screen keyboard uses:
- (A) Random key layout
 - (B) Fixed QWERTY layout
 - (C) Encrypted keys
 - (D) Hardware encryption
33. Online virtual keyboard is safer because it:
- (A) Uses hardware drivers
 - (B) Randomizes key layout
 - (C) Is faster
 - (D) Requires login
-

Malware Distribution

34. Malware can enter a system via:
- (A) Free downloads
 - (B) Spam emails
 - (C) Removable devices
 - (D) All of the above
35. Which malware spreads via network propagation?
- (A) Virus
 - (B) Worm
 - (C) Adware
 - (D) Spyware
-

Signs & Prevention of Malware

36. Frequent pop-ups may indicate:
- (A) Software update
 - (B) Malware infection
 - (C) Hardware failure
 - (D) Browser optimization

37. Which is a preventive measure against malware?

- (A) Using pirated software
- (B) Ignoring updates
- (C) Installing antivirus
- (D) Sharing passwords

38. Firewall helps in:

- (A) Increasing speed
 - (B) Blocking unauthorized access
 - (C) File compression
 - (D) Data backup
-

Antivirus

39. Antivirus software was originally developed to remove:

- (A) Worms
- (B) Viruses
- (C) Spyware
- (D) Adware

40. Modern antivirus software can:

- (A) Only detect viruses
 - (B) Detect and prevent multiple malware types
 - (C) Replace firewall
 - (D) Encrypt user data
-

Malware Detection Techniques

41. Signature-based detection uses:

- (A) Machine learning only
- (B) Virus Definition File
- (C) Network traffic
- (D) Hardware sensors

42. Sandbox detection executes files in:

- (A) Main memory
- (B) Virtual environment
- (C) BIOS
- (D) Network server

43. Heuristic detection compares:

- (A) File size
- (B) Source code patterns
- (C) Hardware usage
- (D) Network speed

44. Real-time protection works when malware:

- (A) Is stored on disk
- (B) Is in active memory

- (C) Is deleted
 - (D) Is compressed
-

Spam

- 45. Spam mainly refers to:
 - (A) Useful communication
 - (B) Unwanted messages
 - (C) Encrypted data
 - (D) System logs
 - 46. Email services filter spam using:
 - (A) Manual checking
 - (B) Automatic algorithms
 - (C) Hardware firewall
 - (D) Virtual keyboard
-

HTTP vs HTTPS

- 47. HTTP transmits data:
 - (A) Encrypted
 - (B) Scrambled
 - (C) As plain text
 - (D) Compressed
 - 48. HTTPS provides security by:
 - (A) Compressing data
 - (B) Encrypting data
 - (C) Deleting cookies
 - (D) Blocking websites
 - 49. HTTPS requires:
 - (A) Firewall
 - (B) SSL Digital Certificate
 - (C) Antivirus
 - (D) Proxy server
-

Firewall

- 50. A firewall primarily acts as:
 - (A) Virus remover
 - (B) Network filter
 - (C) Data compressor
 - (D) Storage manager
- 51. Network firewall is placed:
 - (A) Inside CPU
 - (B) Between networks

- (C) Inside RAM
- (D) On keyboard

52. Host-based firewall monitors:

- (A) Entire internet
 - (B) Single computer traffic
 - (C) Server room
 - (D) Cloud storage
-

Cookies

53. A cookie is stored on:

- (A) Web server
- (B) Client computer
- (C) Router
- (D) ISP server

54. Cookies are mainly used to:

- (A) Infect systems
- (B) Store user browsing data
- (C) Encrypt websites
- (D) Block access

55. Session cookies:

- (A) Store data permanently
 - (B) Expire after timeout
 - (C) Spread malware
 - (D) Encrypt passwords
-

Cookie Threats

56. A cookie that recreates itself after deletion is called:

- (A) Supercookie
- (B) Zombie cookie
- (C) Session cookie
- (D) Secure cookie

57. Third-party cookies are mainly used for:

- (A) Security
 - (B) Advertising and tracking
 - (C) Antivirus updates
 - (D) Data encryption
-

Hackers and Crackers

58. Hackers generally have knowledge of:

- (A) Programming and networks
- (B) Only hardware

- (C) Only databases
- (D) Only web design

59. White hat hackers are also called:

- (A) Crackers
- (B) Ethical hackers
- (C) Hacktivists
- (D) Cyber criminals

60. Black hat hackers mainly:

- (A) Fix vulnerabilities
- (B) Break laws
- (C) Improve security
- (D) Work for organizations

61. Grey hat hackers hack systems mainly:

- (A) For money
- (B) For political gain
- (C) For fun and challenge
- (D) For data backup

Network Security Threats – DoS & DDoS

62. DoS attack aims to:

- (A) Encrypt data
- (B) Block authorized access
- (C) Improve performance
- (D) Update software

63. DDoS attack uses:

- (A) Single system
- (B) Multiple zombie systems
- (C) Antivirus servers
- (D) Firewalls

64. Bot-Net consists of:

- (A) Firewalls
- (B) Zombie computers
- (C) Servers
- (D) Routers

Intrusion Problems

65. Network intrusion refers to:

- (A) Authorized activity
- (B) Unauthorized activity
- (C) Backup process
- (D) Encryption

66. Buffer overflow attack exploits:

- (A) Hardware fault
- (B) Programming error
- (C) Firewall rule
- (D) Network cable

67. Traffic flooding overwhelms:

- (A) Storage device
- (B) Intrusion detection system
- (C) CPU cache
- (D) BIOS

Snooping & Eavesdropping

68. Snooping is also known as:

- (A) Spoofing
- (B) Sniffing
- (C) Flooding
- (D) Hijacking

69. Snooping mainly involves:

- (A) Real-time listening
- (B) Capturing and analyzing traffic
- (C) Deleting data
- (D) Encrypting packets

70. Eavesdropping differs from snooping because it is:

- (A) Stored communication
- (B) Real-time interception
- (C) Authorized monitoring
- (D) Hardware based only
