

MCQ Questions: Exception Handling in Python (Class XII)

1. Errors that occur due to violation of programming language rules are called:

- A. Logical errors
 - B. Runtime errors
 - C. Syntax errors
 - D. Semantic errors
-

2. Syntax errors are also known as:

- A. Runtime errors
 - B. Parsing errors
 - C. Logical errors
 - D. Semantic errors
-

3. When a syntax error is encountered, Python:

- A. Executes remaining code
 - B. Ignores the error
 - C. Stops execution
 - D. Automatically corrects it
-

4. Syntax errors must be:

- A. Ignored
 - B. Handled using try-except
 - C. Rectified before execution
 - D. Converted into runtime errors
-

5. An error that occurs during program execution despite correct syntax is called:

- A. Syntax error
 - B. Logical error
 - C. Exception
 - D. Parsing error
-

6. In Python, exceptions are:

- A. Warnings
 - B. Compiler messages
 - C. Objects representing errors
 - D. Comments
-

7. Which of the following is true about exceptions?

- A. They occur only at compile time
 - B. They always crash the program
 - C. They can be handled by the programmer
 - D. They are syntax errors
-

8. SyntaxError is:

- A. Not an exception
 - B. A runtime error
 - C. A logical error
 - D. An exception
-

9. Built-in exceptions are:

- A. Defined by users
 - B. Defined in the interpreter
 - C. Found only in libraries
 - D. Syntax rules
-

10. Which exception is raised when a value of correct type but invalid value is passed?

- A. TypeError
 - B. ValueError
 - C. IndexError
 - D. NameError
-

11. Which exception is raised when a file cannot be opened?

- A. ImportError
 - B. IOError
 - C. EOFError
 - D. FileError
-

12. KeyboardInterrupt is raised when:

- A. Program ends normally
 - B. User presses Delete or Esc
 - C. File ends
 - D. Division by zero occurs
-

13. Which exception is raised when a module is not found?

- A. ModuleError
 - B. ImportError
 - C. NameError
 - D. IOError
-

14. EOFError occurs when:

- A. File is opened
 - B. End of file is reached without reading data
 - C. File is missing
 - D. File is empty
-

15. Which exception is raised when denominator is zero?

- A. ValueError
 - B. ArithmeticError
 - C. ZeroDivisionError
 - D. OverflowError
-

16. IndexError is raised when:

- A. Wrong data type is used
 - B. Index is out of range
 - C. Variable is undefined
 - D. File is missing
-

17. NameError occurs when:

- A. Variable value is wrong
 - B. Variable is not defined
 - C. Index is invalid
 - D. Division by zero occurs
-

18. Incorrect indentation causes:

- A. SyntaxError
 - B. IndentationError
 - C. TypeError
 - D. NameError
-

19. Which exception occurs when an operator receives an incorrect data type?

- A. TypeError
- B. ValueError

- C. NameError
 - D. IndexError
-

20. OverflowError is raised when:

- A. Input is incorrect
 - B. Value exceeds numeric limit
 - C. Division by zero occurs
 - D. Index goes out of range
-

21. Custom exceptions are also called:

- A. Built-in exceptions
 - B. Runtime exceptions
 - C. User-defined exceptions
 - D. Logical exceptions
-

22. The act of generating an exception is known as:

- A. Catching
 - B. Handling
 - C. Throwing
 - D. Parsing
-

23. Which keyword is used to explicitly raise an exception?

- A. throw
 - B. raise
 - C. except
 - D. error
-

24. Once an exception is raised:

- A. Program continues normally
 - B. Next statement executes
 - C. Remaining code in block is skipped
 - D. Error is ignored
-

25. Stack Traceback provides information about:

- A. Syntax rules
- B. Variable values
- C. Sequence of function calls
- D. Loop execution

26. The assert statement is used to:

- A. Print output
- B. Define variables
- C. Test expressions
- D. Catch exceptions

27. If an assert condition evaluates to false, which exception is raised?

- A. ValueError
- B. AssertionError
- C. TypeError
- D. RuntimeError

28. Assert statements are commonly used:

- A. At the end of program
- B. For file handling
- C. To check valid input
- D. For loops

29. Exception handling helps in:

- A. Improving syntax
- B. Preventing program crash
- C. Increasing execution speed
- D. Reducing memory usage

30. Which block contains code where exception may occur?

- A. except
- B. else
- C. try
- D. finally

31. Which block contains code to handle exceptions?

- A. try
 - B. else
 - C. except
 - D. finally
-

32. If an exception occurs inside try block:

- A. Program terminates
 - B. Remaining try block code executes
 - C. Control moves to except block
 - D. finally block is skipped
-

33. A try block must always be followed by:

- A. else block
 - B. finally block
 - C. except block
 - D. raise statement
-

34. Multiple except blocks are used when:

- A. Only one exception is expected
 - B. No exception is expected
 - C. Multiple exceptions may occur
 - D. finally block is used
-

35. If no matching except block is found:

- A. Program ignores error
 - B. Program continues
 - C. Program terminates
 - D. else block executes
-

36. An except block without exception name:

- A. Must be first
 - B. Must be last
 - C. Cannot be used
 - D. Handles syntax errors only
-

37. The else block executes when:

- A. Exception occurs
 - B. No exception occurs
 - C. finally block executes
 - D. raise is used
-

38. finally block is executed:

- A. Only when exception occurs
 - B. Only when no exception occurs
 - C. Only when else block runs
 - D. In all cases
-

39. finally block is commonly used for:

- A. Printing output
 - B. File closure
 - C. Variable declaration
 - D. Loop termination
-

40. finally block should be placed:

- A. Before try block
 - B. Before except block
 - C. After except and else blocks
 - D. Inside except block
-

41. If an exception is not handled in except blocks:

- A. finally block is skipped
 - B. Exception disappears
 - C. Exception is re-raised after finally
 - D. Program continues normally
-

42. Catching an exception means:

- A. Raising an exception
 - B. Creating an exception
 - C. Executing handler code
 - D. Ignoring error
-

43. The exception object contains:

- A. Only error message
 - B. Error type only
 - C. File name and position
 - D. Source code
-

44. The list of methods searched for exception handler is called:

- A. Function list
- B. Call stack

- C. Stack trace
 - D. Runtime list
-

45. Searching for exception handler starts from:

- A. Main program
 - B. Last called function
 - C. First function
 - D. Global scope
-

46. If no handler is found in call stack:

- A. finally block executes
 - B. Program continues
 - C. Program execution stops
 - D. else block executes
-

47. The process of executing handler code is called:

- A. Throwing
 - B. Parsing
 - C. Catching
 - D. Raising
-

48. Which clause is optional in try-except structure?

- A. try
 - B. except
 - C. else
 - D. Both else and finally
-

49. Which statement interrupts normal flow of execution?

- A. print
 - B. continue
 - C. raise
 - D. pass
-

50. Exception handling separates:

- A. Input and output
- B. Logic and errors
- C. Syntax and semantics
- D. Code and comments

51. Logical errors:

- A. Are syntax errors
 - B. Stop program execution
 - C. Produce wrong output
 - D. Are caught by interpreter
-

52. Runtime errors occur:

- A. Before execution
 - B. During execution
 - C. At compile time
 - D. While writing code
-

53. Exception handlers help in:

- A. Speeding execution
 - B. Making code readable
 - C. Graceful program termination
 - D. Removing syntax errors
-

54. Which keyword is NOT related to exception handling?

- A. try
 - B. except
 - C. finally
 - D. define
-

55. Which statement is correct?

- A. Every exception is syntax error
 - B. Every syntax error is an exception
 - C. Syntax errors are runtime errors
 - D. Exceptions occur only at compile time
-

56. Which exception is raised when input() reaches end of file?

- A. IOError
 - B. EOFError
 - C. ValueError
 - D. ImportError
-

57. Handling exceptions helps in:

- A. Avoiding abrupt program termination
- B. Increasing syntax errors
- C. Reducing runtime errors
- D. Removing logical errors
